NAME: ILORI BLESSING DAVID
COHORT: SUNGLOW MAULERS
CHECKPOINT: INTRO INTO CYBER-SECURITY

In this checkpoint I will be explaining how I used linux OS to navigate some files.

So i was able to download VMware from the link, installed and added kali to the virtual machine. So right now using kali to run these commands
Cat is to run the content of files
I created a file named example.log and example2.log, which is listed below.

Using the head command which is to show the top lines of the content of files in access_log.log which contains the document of example.log and example2.log.
Running the command head access_log.log. See image below

Using the tail command which is to show the bottom lines of the content of files in access_log.log which contains the document of example.log and example2.log.
Running the command tail access_log.log.. See image below

```
┌──(kali㉿kali)-[~]
└─$ tail access_log.log
   363
   364  03/22 08:54:53 INFO   :......term_policyAPI: APITerminate:  Exiting
   365
   366  03/22 08:54:53 INFO   :......term_policyAPI: Policy API terminated
   367  03/22 08:54:53 INFO   :......dreg_process: deregistering process with
 the system
   368  03/22 08:54:53 INFO   :......dreg_process: attempt to dereg (ifaeddrg
_byaddr)
   369  03/22 08:54:53 INFO   :......dreg_process: rc from ifaeddrg_byaddr  r
c =0
   370  03/22 08:54:53 INFO   :.....terminator: process terminated with exit
code 0
   371
   372
```

Grep is used to search a particular word in a content of files;
In my syslog doc I already wrote some text using nano syslog. I added kali and some other words .. see below

```
┌──(kali㉿kali)-[~]
└─$ cat syslog
kali
its great to be here
lets go
man u is shit
```

So using grep to search for kali i ran this command grep -i kali syslog

```
┌──(kali㉿kali)-[~]
└─$ ls
access_log.log  Downloads     Music     syslog     webserver.log
Desktop         example2.log  Pictures  Templates
Documents       example.log   Public    Videos

┌──(kali㉿kali)-[~]
└─$ grep -i kali syslog
kali
```

For grep [plc] access_log.log

```
┌──(kali㉿kali)-[~]
└─$ grep [plc] access_log.log
