CHECKPOINT: ATTACKS, THREATS, VULNERABILITIES & ARCHITECTURE

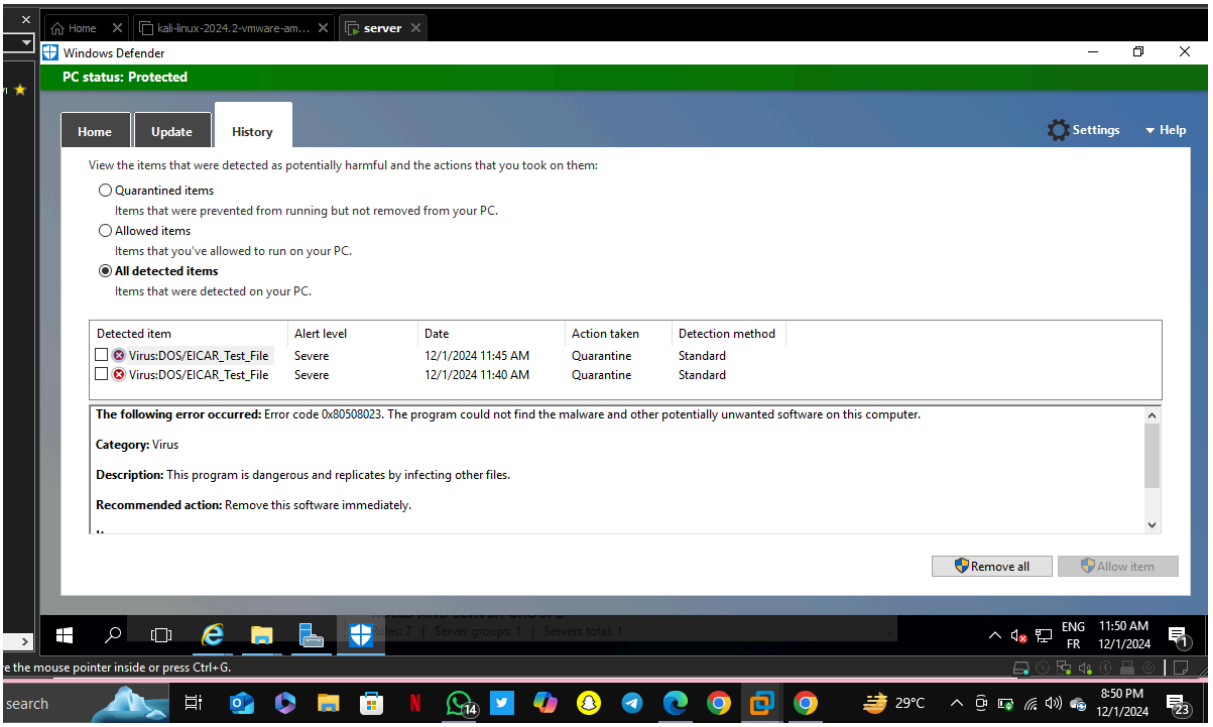

This checkpoint focuses on identifying malicious codes and see if my firewall
In other to identify any malicious file, firstly i had to
Download a virus from my windows server, there was a security alert from my windows defender but i proceeded still for the purpose of this checkpoint. See image below.

Proceeding to installing,during this process I noticed the windows defender blocked the downloaded file, which means it took action instantly, i had to retry for it to be installed successfully. See image below

So, I tried running the file and my Microsoft defender detected the virus that is very dangerous and also replicated by infecting other files. The windows defender took action immediately by quarantine, and removing the software immediately.

Thank you.
